

# What Happens to Your Garage Door in the Winter

## CONTRACTING METAL

Cold weather forces metal to contract, which can add strain to the parts of your garage door that are made out of metal, such as the tracks. The door may then get stuck since the metal no longer gives the door room to move.

## BUSTED SPRINGS

Springs are one of the most vulnerable parts of a garage door during the winter. As mentioned above, metal contracts in colder temperatures. This puts the metal under more strain, causing it to become more brittle and susceptible to cracking under pressure.

## FROZEN DOOR

Your garage door can freeze shut just like your car door does. This generally happens because the threshold is frozen and holding the garage door in place.

## REMOTE ISSUES

Cold weather can result in moisture building up on the battery contacts, disrupting the flow of power.

## HOW CAN I BEST PREPARE MY GARAGE DOOR FOR WINTER?

One of the biggest ways you can prepare your garage door for the harsh winter months is to invest in a preventative maintenance check. Your team of expert garage door repair specialists at Action Garage Door Repair Specialists can help!

During this check, our garage door specialists will readjust your track as necessary and ensure that your garage door weatherstripping is in good shape.

Contact us today for more information about our services and to schedule your maintenance check-up. Together, we can help your garage door beat the cold and keep your home protected all winter long!
